

EXHIBIT J

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

Exhibit E-10

Based on Headwater's apparent positions as to the scope of the patent's claims, as best they can be deciphered, the reference(s) charted below anticipate(s) or at least render(s) obvious the identified claims. The portions of the prior art system documents cited below are not exhaustive but are exemplary in nature. Additional citations may be found in the cover pleading.

This disclosure is not an admission that Samsung concedes any claim construction implied or suggested by Headwater's apparent positions as to the scope of the patent's claims, nor is it an admission by Samsung that any of its products are covered by or infringe the patent's claims, particularly when they are properly construed and applied. Samsung is not taking any claim construction positions through this disclosure, including whether the preamble is a limitation.

Samsung reserves the right to rely on additional citations or sources of evidence that also may be applicable, or that may become applicable in light of claim construction, changes in Headwater's infringement contentions, and/or information obtained during discovery as the case progresses. Samsung further reserves the right to amend or supplement this claim chart at a later date as more fully set forth in the Invalidity Contentions. For example, Defendants are currently in the process of taking discovery from non-parties including Nokia, HMD, Citrix, Google, Apple, and Microsoft. Accordingly, Defendants reserve the right to modify, amend, and/or supplement these contentions as information becomes available from non-parties.

Android is mobile device operating system that was initially released in September 2008. Applications (or "apps") can be installed on mobile devices that run Android. Any mobile device that predates the '224 patent, running an Android version with one or more apps that also predate the '224 patent, qualifies as prior art under at least pre-AIA 35 U.S.C. §§ 102(a)/(b). Such a device was known, used, offered for sale, and/or sold in the United States before the '224 patent.

Exemplary mobile devices that predate the '224 patent and were publicly available before the earliest possible priority date include:¹

- HTC Dream/T-Mobile G1 (released September 2008)
- Samsung GT-I7500 Galaxy (released June 2009)

¹ See, e.g., SAMSUNG_PRIORART0000001-334; SAMSUNG_PRIORART0005174-76; SAMSUNG_PRIORART0005177-317; SAMSUNG_PRIORART0005416-19; SAMSUNG_PRIORART0005420-23; SAMSUNG_PRIORART0005424-28; SAMSUNG_PRIORART0005429-44; SAMSUNG_PRIORART0005445-48; SAMSUNG_PRIORART0005449-52; SAMSUNG_PRIORART0005453-57; SAMSUNG_PRIORART0005458-71; SAMSUNG_PRIORART0005472-77; SAMSUNG_PRIORART0005478-84; SAMSUNG_PRIORART0005485-86; SAMSUNG_PRIORART0005488-5624.

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

- Nexus One (released January 2010)

Exemplary Android versions that predate the '224 patent include:²

- Android 1.0 (released September 2008)
- Android 1.1 (released February 2009)
- Android Cupcake (1.5) (released April 2009)
- Android Donut (1.6) (released September 2009)
- Android Eclair (2.0, 2.0.1, 2.1) (released October 2009 - January 2010)
- Android Froyo (2.2) (released May 20, 2010)

Android included files³ such as ConnectivityManager, NetworkInfo, NetworkStateTracker, ThrottleManager, TrafficStats, ConnectivityManagerMobileTest, Socket, SocketTest, Power, PowerManager, PowerManagerTest, BatteryManager, and BatteryStats.

² See, e.g., SAMSUNG_PRIORART0003998; SAMSUNG_PRIORART0004085; SAMSUNG_PRIORART0004081; SAMSUNG_PRIORART0004086; SAMSUNG_PRIORART0004083; SAMSUNG_PRIORART0004084; GOOG-HEADWATER-00000001-123; HDWTR-GOOG00001-GOOG00013; SAMSUNG_PRIORART0005042; SAMSUNG_PRIORART0005062; SAMSUNG_PRIORART0005350; SAMSUNG_PRIORART0005351; SAMSUNG_PRIORART0005352; SAMSUNG_PRIORART0005353; SAMSUNG_PRIORART0005354; SAMSUNG_PRIORART0005355; SAMSUNG_PRIORART0005356; SAMSUNG_PRIORART0005357; SAMSUNG_PRIORART0005358; SAMSUNG_PRIORART0005359; SAMSUNG_PRIORART0005360; SAMSUNG_PRIORART0005361; SAMSUNG_PRIORART0005362; SAMSUNG_PRIORART0005363; SAMSUNG_PRIORART0005364; SAMSUNG_PRIORART0005046; SAMSUNG_PRIORART0005043; SAMSUNG_PRIORART0005044; SAMSUNG_PRIORART0005045; SAMSUNG_PRIORART0005054; SAMSUNG_PRIORART0005055; SAMSUNG_PRIORART0005056; SAMSUNG_PRIORART0005057; SAMSUNG_PRIORART0005058; SAMSUNG_PRIORART0005059; SAMSUNG_PRIORART0005060; SAMSUNG_PRIORART0005061; SAMSUNG_PRIORART0005318; SAMSUNG_PRIORART0005398; SAMSUNG_PRIORART0005047-53; SAMSUNG_PRIORART0005063-65; SAMSUNG_PRIORART0005066-74; SAMSUNG_PRIORART0005075-135; SAMSUNG_PRIORART0005136-52; SAMSUNG_PRIORART0005153-70; SAMSUNG_PRIORART0005171-73; SAMSUNG_PRIORART0005319-49; SAMSUNG_PRIORART0005365-74; SAMSUNG_PRIORART0005375-83; SAMSUNG_PRIORART0005384-94; SAMSUNG_PRIORART0005395-97; SAMSUNG_PRIORART0005487.

³ The files listed are Java source files, so the filenames are ConnectivityManager.java, NetworkInfo.java, etc., except as noted.

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

Exemplary apps that predate the '224 patent and were publicly available before the earliest possible priority date include:⁴

- JuiceDefender (released January 2010) and its associated add-on application, UltimateJuice (collectively "JuiceDefender App")
- GreenPower (released March 2010)

As specific examples, an HTC Dream/T-Mobile G1, Samsung GT-I7500 Galaxy, or a Nexus One mobile device running any of Android versions 1.0- 2.2 by itself, or with the JuiceDefender or GreenPower applications installed, qualifies as prior art under at least pre-AIA 35 U.S.C. §§ 102(a)/(b). This device was known, used, offered for sale, and/or sold in the United States on or before May 20, 2010. At least the various documents cited in this claim chart describe the functionality of this device.

To the extent it is argued that Android Device with One or More Apps does not disclose or include each and every asserted claim limitation, either expressly or inherently, it would have been obvious to a POSITA to incorporate any of the teachings from the references identified in Exhibits E-01 through E-11, and E-E (whose exemplary citations for each limitation are incorporated herein) into Android Device with One or More Apps. Indeed, it would have been obvious to make such combinations and a POSITA would have had reason and motivation to make such combinations at least for reasons described herein and in the cover pleading.

'224 Claims	Android Device with One or More Apps
[1 pre] A wireless end-user communications device, comprising:	To the extent the preamble is a limitation, Android Device with One or More Apps discloses and/or renders obvious this element. For example, see the following passages and/or figures, as well as related disclosures: <u>Nexus One</u> The Nexus One is an example of an Android smartphone. <i>See, e.g., SAMSUNG_PRIORART0000001 (Nexus) at 17:</i>

⁴ See, e.g., SAMSUNG_PRIORART0000335-SAMSUNG_PRIORART0000383; POUZERATE0000001-POUZERATE0000261.

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

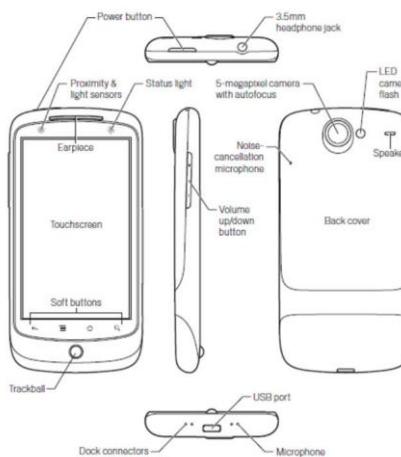

'224 Claims	Android Device with One or More Apps
	<p>Data synchronization</p> <p>Some Google applications on your phone (Gmail, Calendar, and Contacts) give you access to the same personal information that you can add, view, and edit on your computer using Google Web applications. This means that when you add, change, or delete your information in any of these applications on the Web, the updated information also appears on your phone, and vice versa. Also, if you lose your phone or if your phone is destroyed, your personal information is not lost and will appear, as before, on a replacement phone.</p> <p>This mirroring of information happens through over-the-air data synchronization, or data "syncing". Data syncing occurs in the background and shouldn't ever get in your way. You'll know your data is being synchronized when you see this icon in the status bar: .</p> <p>Because sending large amounts of data back and forth over the air can take time and require considerable bandwidth, there are some settings on the phone that allow you to control data sync.</p>

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

Sync by application

To control synchronization for Gmail, Calendar, and Contacts, do the following:

- 1 Press HOME, then press MENU and select Settings.
- 2 Select Data synchronization.

When any of the applications are synchronizing, you will see the "sync" icon: . You will also see the last time your data was synchronized.

- 3 By default, the personal information in Gmail, Calendar, and Contacts will sync whenever you make a change or receive a new message. You can change this behavior:

Auto-sync When selected, Auto-sync will sync Gmail, Calendar, and Contacts automatically, as you make changes or receive new messages. When OFF, information will not be synced automatically, although you can force a sync by using the individual application check boxes described below.

Gmail Clear this check box to exclude Gmail from auto-sync. To force a sync, either clear the check box then select it, or press MENU and select Sync now. To control sync by Gmail label, you must do so from the Gmail settings screen. Read more in "Select labels to synchronize" on page 46.

Calendar Clear this check box to exclude Calendar from auto-sync. To force a sync, either clear the check box then select it, or press MENU and select Sync now.

Contacts Clear this check box to exclude Contacts from auto-sync. To force a sync, either clear the check box then select it, or press MENU and select Sync now.

Cancel sync During a sync you can stop it by pressing MENU and selecting Cancel sync.

Sync problems If you see this icon  to the left of the sync check box, then there was a temporary problem with the data synchronization. Check your data connection and try again later.

	<p>JuiceDefender</p>  <p>JuiceDefender saves battery power (<i>lots of it!</i>) by controlling the device data connection and/or WiFi.</p> <p>You can schedule regular APN/WiFi activation to let background data sync occur and have APN/WiFi enabled while the screen is on. It also helps in minimizing distractions ;)</p> <p>The <i>Easy Mode</i> is a no-fuss one-click way to let your battery last longer - much longer. Just enable JuiceDefender by clicking on the big button and you're ready to go!</p> <p>If you want more fine-grained control, try <i>Advanced Mode</i>, where you can configure all</p> <p>JuiceDefender features to your liking.</p>

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<p>There are 5 triggers for the enable/disable behaviour:</p> <p>Battery - when battery level gets low (less than 15%), disable APN/WiFi, and re-enable them when battery level is restored. APN/WiFi will also be enabled while the device is being recharged.</p> <p>Schedule - regularly enable APN/WiFi for a short period of time, to let background data sync occur (email, Twitter, Facebook, stock quotes...). If Quick is disabled APN/WiFi stays enabled for a longer period, useful if your data connection is very slow or you need to sync lots of data.</p> <p>Night schedule (requires UltimateJuice) - disable APN/WiFi during night time; you can also optionally put the phone in Silent Mode.</p> <p>Screen - enable APN/WiFi while the screen is on to allow browsing, tweeting, procrastination and general internet-powered enjoyment, regardless of scheduled events and battery level.</p> <p>Location (requires UltimateJuice) - this trigger controlled by the 'AutoWiFi' button. It disables WiFi when the device is not in range of any known WiFi network. The location is determined via the cellular network, so it's usually quite coarse. It's a fully automatic set-it-and-forget-it WiFi manager!</p> <p>The priority order of the triggers is 1) location (WiFi only), 2) screen, 3) battery, 4) night schedule, 5) schedule - this means, for example, that when the screen is on APN/WiFi will be enabled even when the battery is low, or that the regular schedule won't occur during the night period.</p> <p>SAMSUNG_PRIORART0000361 (Purdy):</p>

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	 <p>The screenshot shows the Juice Control app interface. At the top, there are buttons for APN, MMS, WiFi, and AutoWiFi, all labeled 'Enabled'. Below these are four 'Triggers' buttons: Screen, Battery, Schedule, and Night. Under 'Location', it says 'Disable WiFi when far from known network'. Under 'Screen', it says 'Enable APN+MMS when screen on'. Under 'Battery', it says 'Disable APN+MMS when battery low'. Under 'Night', it says 'Disable APN+MMS from 10pm to 6:30am'. A large battery icon shows a low level. Under 'Schedule', it says 'Enable APN+MMS 2m every 15m', with a slider set to 15m. Below the slider are buttons for 5m, 15m, 30m, 1h, 2h, and a 'Quick' button. At the bottom, a log shows: '9:36 AM Screen ON', '9:19 AM Screen OFF', and '9:19 AM Night schedule end'.</p> <p>Android: Most phones don't make it easy to switch cellular data connection on and off, even if doing so really helps save your battery. JuiceDefender toggles wireless data and Wi-Fi on and off every so often to preserve power.</p> <p>The whole point of a smartphone with Google apps baked in is constant connectivity, of course, and you don't want to shut off access to your email, Google Voice messages, and other online services. But when you're walking around, at your office desk, and generally not actively using your phone, you probably don't need your phone to check in every minute with the mothership. JuiceDefender lets you set a time interval—5 minutes, 15, 30, an hour, two hours—at which its background process will re-enable your carrier APN, see if there are new messages or data coming in, and then shut off again. You can also set similar Wi-Fi connectivity rules, or only have web data enabled when you've got your screen on. Besides the battery savings, those who like to parse out their email checks and avoid minute-by-minute distractions see some benefit here, too.</p> <p>SAMSUNG_PRIORART0000379 (Latedroid):</p>

U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<p>This overrides the “Screen on setting”: If this is selected and the power is connected, then wireless will be kept on whatever the screen state is.</p> <p>If this is not selected, then Green Power will not make any difference whether the phone is connected to the power or not:: It will regularly switch on and off wireless if needed.</p> <p>Check Traffic</p> <p>If this is selected, then prior to turning off wireless, Green Power will check that there is no network traffic. If there is, it will wait a few seconds and checks again until there is no traffic anymore.”)</p> <p><u>Android 1.0</u></p> <p><u>SAMSUNG PRIORART0005487, Activity</u></p> <ul style="list-style-type: none">* <p>Activities in the system are managed as an activity stack.* When a new activity is started, it is placed on the top of the stack* and becomes the running activity -- the previous activity always remains* below it in the stack, and will not come to the foreground again until* the new activity exits.</p>** <p>An activity has essentially four states:</p>* * If an activity in the foreground of the screen (at the top of* the stack),* it is active or running. * If an activity has lost focus but is still visible (that is, a new non-full-sized* or transparent activity has focus on top of your activity), it* is paused. A paused activity is completely alive (it* maintains all state and member information and remains attached to* the window manager), but can be killed by the system in extreme

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<ul style="list-style-type: none">* low memory situations.* If an activity is completely obscured by another activity,<ul style="list-style-type: none">* it is stopped. It still retains all state and member information,* however, it is no longer visible to the user so its window is hidden* and it will often be killed by the system when memory is needed* elsewhere.* If an activity is paused or stopped, the system can drop the activity<ul style="list-style-type: none">* from memory by either asking it to finish, or simply killing its* process. When it is displayed again to the user, it must be* completely restarted and restored to its previous state.* ** <p>The following diagram shows the important state paths of an Activity.* The square rectangles represent callback methods you can implement to* perform operations when the Activity moves between states. The colored* ovals are major states the Activity can be in.</p>** <p><img src="../../..//images/activity_lifecycle.png" * The entire lifetime of an activity happens between the first call* to {@link android.app.Activity#onCreate} through to a single final call* to {@link android.app.Activity#onDestroy}. An activity will do all setup* of "global" state in onCreate(), and release all remaining resources in* onDestroy(). For example, if it has a thread running in the background* to download data from the network, it may create that thread in onCreate()* and then stop the thread in onDestroy().** The visible lifetime of an activity happens between a call to* {@link android.app.Activity#onStart} until a corresponding call to

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<p>* {@link android.app.Activity#onStop}. During this time the user can see the activity on-screen, though it may not be in the foreground and interacting with the user. Between these two methods you can maintain resources that are needed to show the activity to the user. For example, you can register a {@link android.content.BroadcastReceiver} in onStart() to monitor for changes that impact your UI, and unregister it in onStop() when the user no longer see what you are displaying. The onStart() and onStop() methods can be called multiple times, as the activity becomes visible and hidden to the user.</p> <p>*</p> <p>* The foreground lifetime of an activity happens between a call to {@link android.app.Activity#onResume} until a corresponding call to {@link android.app.Activity#onPause}. During this time the activity is in front of all other activities and interacting with the user. An activity can frequently go between the resumed and paused states -- for example when the device goes to sleep, when an activity result is delivered, when a new intent is delivered -- so the code in these methods should be fairly lightweight.</p> <p>* </p> <p>*</p> <p>* <p>The entire lifecycle of an activity is defined by the following Activity methods. All of these are hooks that you can override to do appropriate work when the activity changes state. All activities will implement {@link android.app.Activity#onCreate} to do their initial setup; many will also implement {@link android.app.Activity#onPause} to commit changes to data and otherwise prepare to stop interacting with the user. You should always call up to your superclass when implementing these methods.</p></p> <p>*</p>

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<pre> <tr><th colspan="2" align="left" border="0">{@link android.app.Activity#onStop onStop()}</th> * <td>Called when the activity is no longer visible to the user, because * another activity has been resumed and is covering this one. This * may happen either because a new activity is being started, an existing * one is being brought in front of this one, or this one is being * destroyed. * <p>Followed by either <code>onRestart()</code> if * this activity is coming back to interact with the user, or * <code>onDestroy()</code> if this activity is going away.</td> * <td align="center">Yes</td> * <td align="center"><code>onRestart()</code> or
 * <code>onDestroy()</code></td> * </tr> * <p>The Android system attempts to keep application process around for as * long as possible, but eventually will need to remove old processes when * memory runs low. As described in Activity * Lifecycle, the decision about which process to remove is intimately * tied to the state of the user's interaction with it. In general, there * are four states a process can be in based on the activities running in it, * listed here in order of importance. The system will kill less important * processes (the last ones) before it resorts to killing more important * processes (the first ones). * * * <p>The foreground activity (the activity at the top of the screen * that the user is currently interacting with) is considered the most important. </pre>

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<p>* Its process will only be killed as a last resort, if it uses more memory than is available on the device. Generally at this point the device has reached a memory paging state, so this is required in order to keep the user interface responsive.</p> <p>* <p>A visible activity (an activity that is visible to the user but not in the foreground, such as one sitting behind a foreground dialog) is considered extremely important and will not be killed unless that is required to keep the foreground activity running.</p> <p>* <p>A background activity (an activity that is not visible to the user and has been paused) is no longer critical, so the system may safely kill its process to reclaim memory for other foreground or visible processes. If its process needs to be killed, when the user navigates back to the activity (making it visible on the screen again), its {@link #onCreate} method will be called with the savedInstanceState it had previously supplied in {@link #onSaveInstanceState} so that it can restart itself in the same state as the user last left it.</p> <p>* <p>An empty process is one hosting no activities or other application components (such as {@link Service} or {@link android.content.BroadcastReceiver} classes). These are killed very quickly by the system as memory becomes low. For this reason, any background operation you do outside of an activity must be executed in the context of an activity BroadcastReceiver or Service to ensure that the system knows it needs to keep your process around.</p> <p>* </p> <p>*</p> <p>/**</p> <p>* Called as part of the activity lifecycle when an activity is going into the background, but has not (yet) been killed. The counterpart to</p>

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<p>* {@link #onResume}.</p> <p>*</p> <p>* <p>When activity B is launched in front of activity A, this callback will</p> <p>* be invoked on A. B will not be created until A's {@link #onPause} returns,</p> <p>* so be sure to not do anything lengthy here.</p> <p>*</p> <p>* <p>This callback is mostly used for saving any persistent state the</p> <p>* activity is editing, to present a "edit in place" model to the user and</p> <p>* making sure nothing is lost if there are not enough resources to start</p> <p>* the new activity without first killing this one. This is also a good</p> <p>* place to do things like stop animations and other things that consume a</p> <p>* noticeable mount of CPU in order to make the switch to the next activity</p> <p>* as fast as possible, or to close resources that are exclusive access</p> <p>* such as the camera.</p> <p>*</p> <p>* <p>In situations where the system needs more memory it may kill paused</p> <p>* processes to reclaim resources. Because of this, you should be sure</p> <p>* that all of your state is saved by the time you return from</p> <p>* this function. In general {@link #onSaveInstanceState} is used to save</p> <p>* per-instance state in the activity and this method is used to store</p> <p>* global persistent data (in content providers, files, etc.)</p> <p>*</p> <p>* <p>After receiving this call you will usually receive a following call</p> <p>* to {@link #onStop} (after the next activity has been resumed and</p> <p>* displayed), however in some cases there will be a direct call back to</p> <p>* {@link #onResume} without going through the stopped state.</p> <p>*</p> <p>* <p>Derived classes must call through to the super class's</p> <p>* implementation of this method. If they do not, an exception will be</p> <p>* thrown.</p></p>

'224 Claims	Android Device with One or More Apps
	<pre>.getTasks(maxNum, 0, null); } catch (RemoteException e) { // System dead, we will be dead too soon! return null; } /** * Set to true if the service has asked to run as a foreground process. */ public boolean foreground;</pre> <p><u>Android 1.6</u></p> <p><u>SAMSUNG_PRIORART0005350, Fundamentals.jd</u></p> <p>Activities</p> <p>An <i>activity</i> presents a visual user interface for one focused endeavor the user can undertake. For example, an activity might present a list of menu items users can choose from or it might display photographs along with their captions. A text messaging application might have one activity that shows a list of contacts to send messages to, a second activity to write the message to the chosen contact, and other activities to review old messages or change settings. Though they work together to form a cohesive user interface, each activity is independent of the others. Each one is implemented as a subclass of the {@link android.app.Activity} base class.</p> <p>An application might consist of just one activity or, like the text messaging application just mentioned, it may contain several. What the activities are, and how many there are depends, of course, on the application and its design. Typically, one of the activities is marked as the first one that should be presented to the user when the application is launched. Moving from one activity to another is accomplished by having the current activity start the next one.</p>

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<p>Each activity is given a default window to draw in. Typically, the window fills the screen, but it might be smaller than the screen and float on top of other windows. An activity can also make use of additional windows — for example, a pop-up dialog that calls for a user response in the midst of the activity, or a window that presents users with vital information when they select a particular item on-screen.</p> <p>The visual content of the window is provided by a hierarchy of views — objects derived from the base {@link android.view.View} class. Each view controls a particular rectangular space within the window. Parent views contain and organize the layout of their children. Leaf views (those at the bottom of the hierarchy) draw in the rectangles they control and respond to user actions directed at that space. Thus, views are where the activity's interaction with the user takes place. For example, a view might display a small image and initiate an action when the user taps that image. Android has a number of ready-made views that you can use — including buttons, text fields, scroll bars, menu items, check boxes, and more.</p> <p>A view hierarchy is placed within an activity's window by the {@link android.app.Activity#setContentView Activity.setContentView()} method. The <i>content view</i> is the View object at the root of the hierarchy. (See the separate User Interface document for more information on views and the hierarchy.)</p> <p>Services</p> <p>A <i>service</i> doesn't have a visual user interface, but rather runs in the background for an indefinite period of time. For example, a service might play background music as the user attends to other matters, or it might fetch data over the network or calculate something and provide the result to activities that need it. Each service extends the {@link android.app.Service} base class.</p> <p>A prime example is a media player playing songs from a play list. The player application would probably have one or more activities that allow the user to choose songs and start playing them. However, the music playback itself would not be handled by an activity because users will expect the music to keep playing even after they leave the player and begin something different. To keep the music going, the media player activity could start a service to run in the background. The system would then keep the music playback service running even after the activity that started it leaves the screen.</p>

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<p>It's possible to connect to (bind to) an ongoing service (and start the service if it's not already running). While connected, you can communicate with the service through an interface that the service exposes. For the music service, this interface might allow users to pause, rewind, stop, and restart the playback.</p> <p>Like activities and the other components, services run in the main thread of the application process. So that they won't block other components or the user interface, they often spawn another thread for time-consuming tasks (like music playback). See Processes and Threads, later.</p> <p>All the activities in a task move together as a unit. The entire task (the entire activity stack) can be brought to the foreground or sent to the background. Suppose, for instance, that the current task has four activities in its stack — three under the current activity. The user presses the HOME key, goes to the application launcher, and selects a new application (actually, a new <i>task</i>). The current task goes into the background and the root activity for the new task is displayed. Then, after a short period, the user goes back to the home screen and again selects the previous application (the previous task). That task, with all four activities in the stack, comes forward. When the user presses the BACK key, the screen does not display the activity the user just left (the root activity of the previous task). Rather, the activity on the top of the stack is removed and the previous activity in the same task is displayed.</p> <p>As noted above, there's never more than one instance of a "<code>{ @code singleTask }</code>" or "<code>{ @code singleInstance }</code>" activity, so that instance is expected to handle all new intents. A "<code>{ @code singleInstance }</code>" activity is always at the top of the stack (since it is the only activity in the task), so it is always in position to handle the intent. However, a "<code>{ @code singleTask }</code>" activity may or may not have other activities above it in the stack. If it does, it is not in position to handle the intent, and the intent is dropped. (Even though the intent is dropped, its arrival would have caused the task to come to the foreground, where it would remain.)</p> <p>An activity has essentially three states:</p> <ul style="list-style-type: none">• It is <i>active</i> or <i>running</i> when it is in the foreground of the screen (at the top of the activity stack for the current task). This is the activity that is the focus for the user's actions.

U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<ul style="list-style-type: none">• It is <i>paused</i> if it has lost focus but is still visible to the user. That is, another activity lies on top of it and that activity either is transparent or doesn't cover the full screen, so some of the paused activity can show through. A paused activity is completely alive (it maintains all state and member information and remains attached to the window manager), but can be killed by the system in extreme low memory situations.• It is <i>stopped</i> if it is completely obscured by another activity. It still retains all state and member information. However, it is no longer visible to the user so its window is hidden and it will often be killed by the system when memory is needed elsewhere. <p>Taken together, these seven methods define the entire lifecycle of an activity. There are three nested loops that you can monitor by implementing them:</p> <ul style="list-style-type: none">• The entire lifetime of an activity happens between the first call to {@link android.app.Activity#onCreate()}} through to a single final call to {@link android.app.Activity#onDestroy()}}. An activity does all its initial setup of "global" state in {@code onCreate()}, and releases all remaining resources in {@code onDestroy()}}. For example, if it has a thread running in the background to download data from the network, it may create that thread in {@code onCreate()} and then stop the thread in {@code onDestroy()}.• The visible lifetime of an activity happens between a call to {@link android.app.Activity#onStart()}} until a corresponding call to {@link android.app.Activity#onStop()}}. During this time, the user can see the activity on-screen, though it may not be in the foreground and interacting with the user. Between these two methods, you can maintain resources that are needed to show the activity to the user. For example, you can register a {@link android.content.BroadcastReceiver} in {@code onStart()}} to monitor for changes that impact your UI, and unregister it in {@code onStop()}} when the user can no longer see what you are displaying. The {@code onStart()} and {@code onStop()} methods can be called multiple times, as the activity alternates between being visible and hidden to the user.• The foreground lifetime of an activity happens between a call to {@link android.app.Activity#onResume()}} until a corresponding call to {@link android.app.Activity#onPause()}}. During this time, the activity is in front of all other

'224 Claims	Android Device with One or More Apps			
	<p>activities on screen and is interacting with the user. An activity can frequently transition between the resumed and paused states — for example, {@code onPause()} is called when the device goes to sleep or when a new activity is started, {@code onResume()} is called when an activity result or a new intent is delivered. Therefore, the code in these two methods should be fairly lightweight.</p> <hr/> <table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 30%; vertical-align: top; padding-right: 10px;"> {@link android.app.Activity#onStart onStart()} </td> <td style="vertical-align: top;"> Called just before the activity becomes visible to the user. Followed by {@code onResume()} if the activity comes to the foreground, or {@code onStop()} if it becomes hidden. </td> <td style="width: 30%; vertical-align: top; text-align: right; padding-left: 10px;"> No or {@code onResume()} {@code onStop()} </td> </tr> </table> <p>Processes and lifecycles The Android system tries to maintain an application process for as long as possible, but eventually it will need to remove old processes when memory runs low. To determine which processes to keep and which to kill, Android places each process into an "importance hierarchy" based on the components running in it and the state of those components. Processes with the lowest importance are eliminated first, then those with the next lowest, and so on. There are five levels in the hierarchy. The following list presents them in order of importance:</p> <ol style="list-style-type: none"> 1. A foreground process is one that is required for what the user is currently doing. A process is considered to be in the foreground if any of the following conditions hold: <ul style="list-style-type: none"> o It is running an activity that the user is interacting with (the Activity object's {@link android.app.Activity#onResume onResume()} method has been called). o It hosts a service that's bound to the activity that the user is interacting with. o It has a {@link android.app.Service} object that's executing one of its lifecycle callbacks ({@link android.app.Service#onCreate onCreate()}, {@link android.app.Service#onStart onStart()}, or {@link android.app.Service#onDestroy onDestroy()}). o It has a {@link android.content.BroadcastReceiver} object that's executing its {@link android.content.BroadcastReceiver#onReceive onReceive()} method. <p>Only a few foreground processes will exist at any given time. They are killed only as a last resort — if memory is so low that they cannot all continue to run. Generally, at that point, the device</p>	{@link android.app.Activity#onStart onStart()}	Called just before the activity becomes visible to the user. Followed by {@code onResume()} if the activity comes to the foreground, or {@code onStop()} if it becomes hidden.	No or {@code onResume()} {@code onStop()}
{@link android.app.Activity#onStart onStart()}	Called just before the activity becomes visible to the user. Followed by {@code onResume()} if the activity comes to the foreground, or {@code onStop()} if it becomes hidden.	No or {@code onResume()} {@code onStop()}

'224 Claims	Android Device with One or More Apps
	<p>has reached a memory paging state, so killing some foreground processes is required to keep the user interface responsive.</p> <p>2. A visible process is one that doesn't have any foreground components, but still can affect what the user sees on screen. A process is considered to be visible if either of the following conditions holds:</p> <ul style="list-style-type: none">o It hosts an activity that is not in the foreground, but is still visible to the user (its {@link android.app.Activity#onPause onPause()} method has been called). This may occur, for example, if the foreground activity is a dialog that allows the previous activity to be seen behind it.o It hosts a service that's bound to a visible activity. <p>A visible process is considered extremely important and will not be killed unless doing so is required to keep all foreground processes running.</p> <p>3. A service process is one that is running a service that has been started with the {@link android.content.Context#startService startService()} method and that does not fall into either of the two higher categories. Although service processes are not directly tied to anything the user sees, they are generally doing things that the user cares about (such as playing an mp3 in the background or downloading data on the network), so the system keeps them running unless there's not enough memory to retain them along with all foreground and visible processes.</p> <p>4. A background process is one holding an activity that's not currently visible to the user (the Activity object's {@link android.app.Activity#onStop onStop()} method has been called). These processes have no direct impact on the user experience, and can be killed at any time to reclaim memory for a foreground, visible, or service process. Usually there are many background processes running, so they are kept in an LRU (least recently used) list to ensure that the process with the activity that was most recently seen by the user is the last to be killed. If an activity implements its lifecycle methods correctly, and captures its current state, killing its process will not have a deleterious effect on the user experience.</p> <p>5. An empty process is one that doesn't hold any active application components. The only reason to keep such a process around is as a cache to improve startup time the next time a component needs to run in it. The system often kills these processes in order to balance overall system resources between process caches and the underlying kernel caches.</p>

For example, an activity might present a list of menu items users can choose from or it might display photographs along with their captions. A text messaging application might have one activity that shows a list of contacts to send messages to, a second activity to write the message to the chosen contact, and other activities to review old messages or change settings. Though they work together to form a cohesive user interface, each activity is independent of the others. Each one is implemented as a subclass of the {@link android.app.Activity} base class.</p> <p>An application might consist of just one activity or, like the text messaging application just mentioned, it may contain several. What the activities are, and how many there are depends, of course, on the application and its design. Typically, one of the activities is marked as the first one that should be presented to the user when the application is launched. Moving from one activity to another is accomplished by having the current activity start the next one.</p>

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<p>Each activity is given a default window to draw in. Typically, the window fills the screen, but it might be smaller than the screen and float on top of other windows. An activity can also make use of additional windows — for example, a pop-up dialog that calls for a user response in the midst of the activity, or a window that presents users with vital information when they select a particular item on-screen.</p> <p>The visual content of the window is provided by a hierarchy of views — objects derived from the base {@link android.view.View} class. Each view controls a particular rectangular space within the window. Parent views contain and organize the layout of their children. Leaf views (those at the bottom of the hierarchy) draw in the rectangles they control and respond to user actions directed at that space. Thus, views are where the activity's interaction with the user takes place. For example, a view might display a small image and initiate an action when the user taps that image. Android has a number of ready-made views that you can use — including buttons, text fields, scroll bars, menu items, check boxes, and more.</p> <p>A view hierarchy is placed within an activity's window by the {@link android.app.Activity#setContentView Activity.setContentView()} method. The <i>content view</i> is the View object at the root of the hierarchy. (See the separate User Interface document for more information on views and the hierarchy.)</p> <p>Services</p> <p>A <i>service</i> doesn't have a visual user interface, but rather runs in the background for an indefinite period of time. For example, a service might play background music as the user attends to other matters, or it might fetch data over the network or calculate something and provide the result to activities that need it. Each service extends the {@link android.app.Service} base class.</p> <p>A prime example is a media player playing songs from a play list. The player application would probably have one or more activities that allow the user to choose songs and start playing them. However, the music playback itself would not be handled by an activity because users will expect the music to keep playing even after they leave the player and begin something different. To keep the music going, the media player activity could start a service to run in the background. The system would then keep the music playback service running even after the activity that started it leaves the screen.</p>

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<p>It's possible to connect to (bind to) an ongoing service (and start the service if it's not already running). While connected, you can communicate with the service through an interface that the service exposes. For the music service, this interface might allow users to pause, rewind, stop, and restart the playback.</p> <p>Like activities and the other components, services run in the main thread of the application process. So that they won't block other components or the user interface, they often spawn another thread for time-consuming tasks (like music playback). See Processes and Threads, later.</p> <p>All the activities in a task move together as a unit. The entire task (the entire activity stack) can be brought to the foreground or sent to the background. Suppose, for instance, that the current task has four activities in its stack — three under the current activity. The user presses the HOME key, goes to the application launcher, and selects a new application (actually, a new <i>task</i>). The current task goes into the background and the root activity for the new task is displayed. Then, after a short period, the user goes back to the home screen and again selects the previous application (the previous task). That task, with all four activities in the stack, comes forward. When the user presses the BACK key, the screen does not display the activity the user just left (the root activity of the previous task). Rather, the activity on the top of the stack is removed and the previous activity in the same task is displayed.</p> <p>As noted above, there's never more than one instance of a "<code>{ @code singleTask}</code>" or "<code>{ @code singleInstance}</code>" activity, so that instance is expected to handle all new intents. A "<code>{ @code singleInstance}</code>" activity is always at the top of the stack (since it is the only activity in the task), so it is always in position to handle the intent. However, a "<code>{ @code singleTask}</code>" activity may or may not have other activities above it in the stack. If it does, it is not in position to handle the intent, and the intent is dropped. (Even though the intent is dropped, its arrival would have caused the task to come to the foreground, where it would remain.)</p> <p>An activity has essentially three states:</p> <ul style="list-style-type: none">• It is <i>active</i> or <i>running</i> when it is in the foreground of the screen (at the top of the activity stack for the current task). This is the activity that is the focus for the user's actions.

U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<ul style="list-style-type: none">• It is <i>paused</i> if it has lost focus but is still visible to the user. That is, another activity lies on top of it and that activity either is transparent or doesn't cover the full screen, so some of the paused activity can show through. A paused activity is completely alive (it maintains all state and member information and remains attached to the window manager), but can be killed by the system in extreme low memory situations.• It is <i>stopped</i> if it is completely obscured by another activity. It still retains all state and member information. However, it is no longer visible to the user so its window is hidden and it will often be killed by the system when memory is needed elsewhere. <p>Taken together, these seven methods define the entire lifecycle of an activity. There are three nested loops that you can monitor by implementing them:</p> <ul style="list-style-type: none">• The entire lifetime of an activity happens between the first call to {@link android.app.Activity#onCreate()}} through to a single final call to {@link android.app.Activity#onDestroy()}}. An activity does all its initial setup of "global" state in {@code onCreate()}, and releases all remaining resources in {@code onDestroy()}}. For example, if it has a thread running in the background to download data from the network, it may create that thread in {@code onCreate()} and then stop the thread in {@code onDestroy()}.• The visible lifetime of an activity happens between a call to {@link android.app.Activity#onStart()}} until a corresponding call to {@link android.app.Activity#onStop()}}. During this time, the user can see the activity on-screen, though it may not be in the foreground and interacting with the user. Between these two methods, you can maintain resources that are needed to show the activity to the user. For example, you can register a {@link android.content.BroadcastReceiver} in {@code onStart()}} to monitor for changes that impact your UI, and unregister it in {@code onStop()}} when the user can no longer see what you are displaying. The {@code onStart()} and {@code onStop()} methods can be called multiple times, as the activity alternates between being visible and hidden to the user.• The foreground lifetime of an activity happens between a call to {@link android.app.Activity#onResume()}} until a corresponding call to {@link android.app.Activity#onPause()}}. During this time, the activity is in front of all other

Exhibit E-10 to Defendants' Amended Invalidity Contentions

'224 Claims	Android Device with One or More Apps			
	<p>activities on screen and is interacting with the user. An activity can frequently transition between the resumed and paused states — for example, {@code onPause()} is called when the device goes to sleep or when a new activity is started, {@code onResume()} is called when an activity result or a new intent is delivered. Therefore, the code in these two methods should be fairly lightweight.</p> <hr/> <table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 30%; vertical-align: top; padding-right: 10px;"> {@link android.app.Activity#onStart onStart()} </td> <td style="vertical-align: top;"> Called just before the activity becomes visible to the user. Followed by {@code onResume()} if the activity comes to the foreground, or {@code onStop()} if it becomes hidden. </td> <td style="width: 30%; vertical-align: top; text-align: right;"> No or {@code onResume()} {@code onStop()} </td> </tr> </table> <p>Processes and lifecycles The Android system tries to maintain an application process for as long as possible, but eventually it will need to remove old processes when memory runs low. To determine which processes to keep and which to kill, Android places each process into an "importance hierarchy" based on the components running in it and the state of those components. Processes with the lowest importance are eliminated first, then those with the next lowest, and so on. There are five levels in the hierarchy. The following list presents them in order of importance:</p> <p>6. A foreground process is one that is required for what the user is currently doing. A process is considered to be in the foreground if any of the following conditions hold:</p> <ul style="list-style-type: none"> o It is running an activity that the user is interacting with (the Activity object's {@link android.app.Activity#onResume onResume()} method has been called). o It hosts a service that's bound to the activity that the user is interacting with. o It has a {@link android.app.Service} object that's executing one of its lifecycle callbacks ({@link android.app.Service#onCreate onCreate()}, {@link android.app.Service#onStart onStart()}, or {@link android.app.Service#onDestroy onDestroy()}). o It has a {@link android.content.BroadcastReceiver} object that's executing its {@link android.content.BroadcastReceiver#onReceive onReceive()} method. <p>Only a few foreground processes will exist at any given time. They are killed only as a last resort — if memory is so low that they cannot all continue to run. Generally, at that point, the device</p>	{@link android.app.Activity#onStart onStart()}	Called just before the activity becomes visible to the user. Followed by {@code onResume()} if the activity comes to the foreground, or {@code onStop()} if it becomes hidden.	No or {@code onResume()} {@code onStop()}
{@link android.app.Activity#onStart onStart()}	Called just before the activity becomes visible to the user. Followed by {@code onResume()} if the activity comes to the foreground, or {@code onStop()} if it becomes hidden.	No or {@code onResume()} {@code onStop()}

'224 Claims	Android Device with One or More Apps
	<p>has reached a memory paging state, so killing some foreground processes is required to keep the user interface responsive.</p> <p>7. A visible process is one that doesn't have any foreground components, but still can affect what the user sees on screen. A process is considered to be visible if either of the following conditions holds:</p> <ul style="list-style-type: none">○ It hosts an activity that is not in the foreground, but is still visible to the user (its {@link android.app.Activity#onPause onPause()} method has been called). This may occur, for example, if the foreground activity is a dialog that allows the previous activity to be seen behind it.○ It hosts a service that's bound to a visible activity. <p>A visible process is considered extremely important and will not be killed unless doing so is required to keep all foreground processes running.</p> <p>8. A service process is one that is running a service that has been started with the {@link android.content.Context#startService startService()} method and that does not fall into either of the two higher categories. Although service processes are not directly tied to anything the user sees, they are generally doing things that the user cares about (such as playing an mp3 in the background or downloading data on the network), so the system keeps them running unless there's not enough memory to retain them along with all foreground and visible processes.</p> <p>9. A background process is one holding an activity that's not currently visible to the user (the Activity object's {@link android.app.Activity#onStop onStop()} method has been called). These processes have no direct impact on the user experience, and can be killed at any time to reclaim memory for a foreground, visible, or service process. Usually there are many background processes running, so they are kept in an LRU (least recently used) list to ensure that the process with the activity that was most recently seen by the user is the last to be killed. If an activity implements its lifecycle methods correctly, and captures its current state, killing its process will not have a deleterious effect on the user experience.</p> <p>10. An empty process is one that doesn't hold any active application components. The only reason to keep such a process around is as a cache to improve startup time the next time a component needs to run in it. The system often kills these processes in order to balance overall system resources between process caches and the underlying kernel caches.</p>

U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<p>A key to how Android handles applications in this way is that processes don't shut down cleanly. When the user leaves an application, its process is kept around in the background, allowing it to continue working (for example downloading web pages) if needed, and come immediately to the foreground if the user returns to it. If a device never runs out of memory, then Android will keep all of these processes around, truly leaving all applications "running" all of the time.</p> <p>Explicitly running in the background</p> <p>So far, we have a way for applications to implicitly do work in the background, as long as the process doesn't get killed by Android as part of its regular memory management. This is fine for things like loading web pages in the background, but what about features with harder requirements? Background music playback, data synchronization, location tracking, alarm clocks, etc.</p> <p>For these tasks, the application needs a way to tell Android "I would explicitly like to run at this point." There are two main facilities available to applications for this, represented by two kinds of components they can publish in their manifest: <i>broadcast receivers</i> and <i>services</i>.</p>

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<p>Broadcast Receivers</p> <p>A BroadcastReceiver allows an application to run, for a brief amount of time, in the background as a result of something else happening. It can be used in many ways to build higher-level facilities: for example the AlarmManager allows an application to have a broadcast sent at a certain time in the future, and the LocationManager can send a broadcast when it detects interesting changes in location. Because information about the receiver is part of an application's manifest, Android can find and launch the application even if it isn't running; of course if it already has its process available in the background, the broadcast can very efficiently be directly dispatched to it.</p> <p>When handling a broadcast, the application is given a fixed set of time (currently 10 seconds) in which to do its work. If it doesn't complete in that time, the application is considered to be misbehaving, and its process immediately tossed into the background state to be killed for memory if needed.</p> <p>Broadcast receivers are great for doing small pieces of work in response to an external stimulus, such as posting a notification to the user after being sent a new GPS location report. They are very lightweight, since the application's process only needs to be around while actively receiving the broadcast. Because they are active for a deterministic amount of time, fairly strong guarantees can be made about not killing their process while running. However they are not appropriate for anything of indeterminate length, such as networking.</p>

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<p>Services</p> <p>A Service allows an application to implement longer-running background operations. There are actually a lot of other functions that services provide, but for the discussion here their fundamental purpose is for an application to say "hey I would like to continue running even while in the background, until I say I am done." An application controls when its service runs by explicitly starting and stopping the service.</p> <p>While services do provide a rich client-server model, its use is optional. Upon starting an application's services, Android simply instantiates the component in the application's process to provide its context. How it is used after that is up to the application: it can put all of the needed code inside of the service itself without interacting with other parts of the application, make calls on other singleton objects shared with other parts of the app, directly retrieve the Service instance from elsewhere if needed, or run it in another process and do a full-blown RPC protocol if that is desired.</p> <p>Process management for services is different than broadcast receivers, because an unbounded number of services can ask to be running for an unknown amount of time. There may not be enough RAM to have all of the requesting services run, so as a result no strong guarantees are made about being able to keep them running.</p> <p>If there is too little RAM, processes hosting services will be immediately killed like background processes are. However, if appropriate, Android will remember that these services wish to remain running, and restart their process at a later time when more RAM is available. For example, if the user goes to a web page that requires large amounts of RAM, Android may kill background service processes like sync until the browser's memory needs go down.</p> <p>Services can further negotiate this behavior by requesting they be considered "foreground." This places the service in a "please don't kill" state, but requires that it include a notification to the user about it actively running. This is useful for services such as background music playback or car navigation, which the user is actively aware of; when you're playing music and using the browser, you can always see the music-playing glyph in the status bar. Android won't try to kill these services, but as a trade-off, ensures the user knows about them and is able to explicitly stop them when desired.</p>

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<p>The value of generic components</p> <p>Android's generic broadcast receiver and service components allow developers to create a wide variety of efficient background operations, including things that were never originally considered. In Android 1.0 they were used to implement nearly all of the background behavior that the built-in and proprietary Google apps provided:</p> <ul style="list-style-type: none">• Music playback runs in a service to allow it to continue operating after the user leaves the music application.• The alarm clock schedules a broadcast receiver with the alarm manager, to go off at the next set alarm time.

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
	<p><u>SAMSUNG PRIORART0005350, PowerManager</u></p> <pre>/** * This class gives you control of the power state of the device. * * <p>Device battery life will be significantly affected by the use of this API. Do not * acquire WakeLocks unless you really need them, use the minimum levels possible, and be sure * to release it as soon as you can. * * <p>You can obtain an instance of this class by calling * {@link android.content.Context#getSystemService(java.lang.String) Context.getSystemService()}. * * <p>The primary API you'll use is {@link #newWakeLock(int, String) newWakeLock()}. This will * create a {@link PowerManager.WakeLock} object. You can then use methods on this object to * control the power state of the device. In practice it's quite simple: * * {@samplecode * PowerManager pm = (PowerManager) getSystemService(Context.POWER_SERVICE); * PowerManager.WakeLock wl = pm.newWakeLock(PowerManager.SCREEN_DIM_WAKE_LOCK, * "My Tag"); * wl.acquire(); * ..screen will stay on during this section.. * wl.release(); * } * * <p>The following flags are defined, with varying effects on system power. <i>These flags are * mutually exclusive - you may only specify one of them.</i> * <table border="2" width="85%" align="center" frame="hsides" rules="rows"></pre>

Exhibit E-10 to Defendants' Amended Invalidity Contentions

	Storage	
[2] The wireless end-user communications device of claim 1, wherein the dynamically selected service usage control policy for a given network service usage activity is further selected based on an application behavior for the application associated with that network service usage activity.	Flash memory: 512MB RAM: 512MB microSD card: 4GB microSD card included (expandable to 32GB)	
[3] The wireless end-user communications device of claim 1, wherein the dynamically selected service usage control policy for a given	Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures: <i>See, e.g.,</i> the disclosures identified for claims [1 pre] – [1g].	

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
network service usage activity is further selected based on whether the application associated with that network service usage activity is currently in the foreground of user interaction.	
[4] The wireless end-user communications device of claim 1, wherein the set of service usage control policies further comprises a third policy that blocks data communication associated with the given network service usage activity.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre] – [1g].</p>
[5] The wireless end-user communications device of claim 1, wherein the dynamically selected service usage control policy for a given network service usage	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre] – [1g].</p>

U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
activity is further selected based on a messaging layer behavior for the application associated with that network service usage activity.	
[6] The wireless end-user communications device of claim 1, wherein for the second policy that defers data communication associated with the given network service usage activity until the device state change occurs, the device state change comprises a change in device power state.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre] – [1g].</p>
[7] The wireless end-user communications device of claim 1, wherein for the second policy that defers data communication associated with the given network service usage	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre] – [1g].</p>

U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
activity until the device state change occurs, the device state change comprises a change from a modem power save state that is not triggered by the given network service usage activity.	
[8] The wireless end-user communications device of claim 1, wherein for the second policy that defers data communication associated with the given network service usage activity until the device state change occurs, the device state change comprises a change to a network connection state that is not triggered by the given network service usage activity.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre] – [1g].</p>
[9] The wireless end-user communications device of claim 1, wherein for the second	Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
policy that defers data communication associated with the given network service usage activity until the device state change occurs, the device state change comprises an aggregation of demand from multiple network service usage activity.	<i>See, e.g.</i> , the disclosures identified for claims [1 pre] – [1g].
[10] The wireless end-user communications device of claim 1, wherein for the second policy that defers data communication associated with the given network service usage activity until the device state change occurs, the device state change comprises a change in user interaction with the wireless end-user communications device.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.</i>, the disclosures identified for claims [1 pre] – [1g].</p>
[11] The wireless end-user communications	Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
device of claim 1, wherein the dynamic selection of the service usage control policy is further based on a user preference setting for a given one of the applications.	<p><i>See, e.g.,</i> the disclosures identified for claims [1 pre] – [1g].</p>
[12] The wireless end-user communications device of claim 1, wherein the processor is further configured to monitor power consumption for each of the plurality of applications, and wherein the dynamic selection of the service usage control policy for a given network service usage activity is further based on the monitored power consumption for the application associated with the given network service usage activity.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre] – [1g].</p>

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
[13] The wireless end-user communications device of claim 1, wherein the processor is further configured to monitor network service usage behavior for each of the plurality of applications, and wherein the dynamic selection of the service usage control policy for a given network service usage activity is further based on a comparison of the monitored network service usage behavior for the application associated with the given network service usage activity to expected access limits for that application.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre] – [1g].</p>
[14] The wireless end-user communication device of claim 13, wherein the dynamic selection of the service usage control policy	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre] – [1g].</p>

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
restricts network access due to the monitored network service usage behavior exceeding the expected access limits for the application associated with the given network service usage activity.	
[15] The wireless end-user communication device of claim 1, wherein the second policy limits an allowable duration of network access events for a given application.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre] – [1g].</p>
[16] The wireless end-user communication device of claim 1, wherein the second policy time windows network access events for a given application.	<p>Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:</p> <p><i>See, e.g.,</i> the disclosures identified for claims [1 pre] – [1g].</p>
[17] The wireless end-user communication device of claim 1,	Android Device with One or More Apps discloses and/or renders obvious this limitation. For example, see the following passages and/or figures, as well as related disclosures:

Exhibit E-10 to Defendants' Amended Invalidity Contentions
U.S. Patent No. 11,405,224

'224 Claims	Android Device with One or More Apps
wherein the at least one wireless modem comprises first and second modems, and wherein the service usage control policy dynamically selected for at least one given one of the network service usage activities is further selected in dependence upon which of the first and second modems will supply network connectivity for that network service usage activity.	<i>See, e.g.</i> , the disclosures identified for claims [1 pre] – [1g].
